User Guide**

Appendix D

**PSS-PG Interface End-to-End Test Pre-
Validation Exercise**

The objective of this exercise is to facilitate participants to ready their PSS to conduct the PSS End-to-End test. In this exercise, HKEX would provide the following facilities to participants :

- A set of sample PG “output messages” on the 44 optional PG messages (in text file format and attached in this package). Participants can capture these output messages into their PSS for validating their PSS in processing expected PG outputs to be produced during coming end-to-end test.
- Participants can provide sample “input messages” generated from their PSS to HKEX. HKEX would then capture their input messages into HKEX testing environment for format validation. Results and issues (if any) would be presented to participants.

Participants who want to have their PSS “input message” validate by HKEX should submit the message details to HKEX. For the testing results of “output message”, this is highly recommended participants can provide status update to HKEX and approach PSS support team for assistance in case of issue encountered.

To ensure a smooth execution of the End-to-End test, participants are highly recommended to verify as many PG-PSS interfaces as possible through the above facilitates and establish a close communication with HKEX support team.
