HKSCC－VaR Platform<br>Initial Margin Calculation Guide

## 1．INTRODUCTION

Hong Kong Securities Clearing Company Limited（＂HKSCC＂）adopts VaR Platform to determine the initial margin（＂IM＂）requirement of Clearing Participants＇（＂CPs＂）portfolios． The model contains portfolio margin component for Primary Tier（＂Tier P＂）instruments，flat rate margin component for Non－constituent Tier（＂Tier N＂）instruments，corporate action position margin component and other margin add－on components．

The VaR Platform is developed in accordance with the regulatory requirements and international best practices（e．g．，CPMI－IOSCO Principles for Financial Market Infrastructures）．To promote transparency of the model，a file containing the key risk parameters required for calculating IM（a．k．a．，＂Initial Margin Risk Parameter File＂，or ＂IMRPF＂）will be disseminated to all HKSCC＇s CPs on a daily basis upon the launch of VaR Platform．

This document outlines how to use the Initial Margin Risk Parameter File to calculate the total MTM and margin requirement of a portfolio for HKSCC clearable instruments in Hong Kong market．

## 2．INITIAL MARGIN RISK PARAMETER FILE

## 2．1 Layout of Initial Margin Risk Parameter File

An Initial Margin Risk Parameter File ${ }^{1}$（i．e．，RPF01）will be generated in csv format and could be downloaded by CPs on each business day ${ }^{2}$ ．The layout of the file is shown below：

## RPF01：

This file includes instrument price returns for historical Value－at－Risk（＂HVaR＂）scenarios， stress Value－at－Risk（＂SVaR＂）scenarios，flat rate margin scenarios，beta hedge information for liquidation risk add－on，instrument delta information for liquidation risk add－on，price threshold and add－on\％for structured product add－on and corporate action position margin scenarios．

## 2．2 Specifications of Initial Margin Risk Parameter File

| Field Name | Description | Format |
| :---: | :---: | :---: |
| Valuation＿DT | Valuation date | DD／MM／YYYY |
| HVaR＿WGT | Weighting of the historical Value－at－Risk （＂HVaR＂）component in the initial margin model | DECIMALS（X，10）${ }^{\text {；}}$ |
| SVaR＿WGT | Weighting of the stress Value－at－Risk （＂SVaR＂）component in the initial margin model | DECIMALS（X，10）； |
| HVaR＿Scen＿Count | Number of scenarios used for calculating HVaR component | INTEGER（X，0）${ }^{3}$ ； <br> e．g．，a value of 1000 means 1000 risk scenarios for HVaR calculation． |
| SVaR＿Scen＿Count | Number of scenarios used for calculating SVaR component | INTEGER（X，0）； <br> e．g．，a value of 1018 means 1018 risk scenarios for Stress VaR calculation． |
| STV＿Count ${ }^{4}$ | Number of stress test scenarios | INTEGER（X，0）； <br> e．g．，a value of 200 means 200 stress test scenarios for STV． |
| HVaR＿CL | Confidence level applied to HVaR | DECIMALS（X，10）； <br> e．g．，a value of 0.994 means $99.4 \%$ confidence level． |
| SVaR＿CL | Confidence level applied to SVaR | DECIMALS（X，10）； <br> e．g．，a value of 0.98 means $98 \%$ confidence level． |
| HVaR＿Measure | Risk measure type for HVaR component | 4 －FHS ES（Discrete）${ }^{5}$ |
| SVaR＿Measure | Risk measure type for SVaR component | 4 －FHS ES（Discrete） |
| Rounding | Rounding parameter for margin calculation | INTEGER（X，0）； <br> e．g．，a value of 10,000 means to round up the figure to 10,000 ． |
| Holiday＿Factor | Scaling factor for calculating holiday add－ on．It is calculated as square $\operatorname{root}(\mathrm{H})-1$ ， where H is the number of consecutive Hong Kong holidays excluding Saturdays and Sundays | DECIMALS（X，10） |
| InstrumentID | Instrument identifier e．g．Stock code，or underlying stock code for corporate action position margin instruments like distribution in specie （＂DSP＂），cash dividend（＂DIV＂），rights issue（＂SRI＂），etc． | TEXT |

[^1]| Field Name | Description | Format |
| :---: | :---: | :---: |
| FieldType | Label to indicate the record type： <br> 1 －HVaR Scenarios <br> 2 －SVaR Scenarios <br> 3 －Flat Rate Scenarios <br> 4 －Beta hedge information for liquidation risk add－on <br> 5 －Instrument delta information for liquidation risk add－on <br> 6 －Price threshold and add－on\％for structured product add－on <br> 7 －Corporate action position margin scenarios | INTEGER（X，0） |
| FieldType 1 Columns | Scenario returns for each instrument in HVaR component <br> On the right of＂FieldType 1 ＂： <br> －total number of scenarios should be same as＂HVaR Scen Count＂ | DECIMALS（X，10） |
| FieldType 2 Columns | Scenario returns for each instrument in SVaR component <br> On the right of＂FieldType 2＂： <br> －total number of scenarios should be same as＂SVaR＿Scen＿Count＂ | DECIMALS（X，10） |
| FieldType 3 Columns | Return for each instrument in flat rate margin component | DECIMALS（X，10） |
| FieldType 4 Columns | margin component On the right of＂FieldType 4＂： |  |
|  | －1st column：Bucket rate | DECIMALS（X，10） |
|  | －2nd column：Instrument beta | DECIMALS（X，10） |
|  | －3rd column：Delta equivalent position market value threshold | INTEGER（X，0） |
|  | －4th column：Cash delta per quantity（i．e．，market price） | DECIMALS（X，10） |
| FieldType 5 Columns | On the right of＂FieldType 5＂： |  |
|  | －1st column：Underlying group | TEXT |
|  | －2nd column：Delta | DECIMALS（X，10） |
|  | －3rd column：Conversion ratio | DECIMALS（X，10） |
|  | －4th column：Cash delta per quantity | DECIMALS（X，10） |
| FieldType 6 Columns | On the right of＂FieldType 6＂： |  |
|  | －1st column：Price threshold | DECIMALS（X，10） |
|  | －2nd column：One－tenth of tick size multiplier | DECIMALS（X，10） |
| FieldType 7 Columns | On the right of＂FieldType 7＂： |  |
|  | －1st column：Benefit entitlement type | INTEGER（X，0） <br> 1 －Distribution in specie <br> 2 －Rights issue <br> 3 －Cash dividend |
|  | 2nd column：Price of the benefit entitlement（Shows 1 for cash dividend） | DECIMALS（X，10） |
|  | －3rd column：Short position add－ on\％ | DECIMALS（X，10） |
|  | －4th column：Long position add－ on\％ | DECIMALS（X，10） |
| Numbers next to ＂FieldType＂ | Scenario numbers | INTEGER（X，0） |

## 3．CALCULATION OF TOTAL MTM AND MARGIN REQUIREMENT

## 3．1 Required Inputs

## 3．1．1 Risk Parameters and Margin Adjustments

To derive total MTM and margin requirement，the risk parameters（including market risk and other risk components）and margin adjustments below are required．The sources are stated as follows：

|  |  | Source |  |
| :---: | :---: | :---: | :---: |
|  |  | IMRPF | MTM ${ }^{6}$ and Margin Requirement Report ${ }^{7}$ |
| Market risk component | Portfolio margin | Y | － |
|  | Flat rate margin | Y | － |
|  | Liquidation risk add－on | Y | － |
|  | Structured product add－on | Y | － |
|  | Corporate action position margin ${ }^{8}$ | Y | － |
|  | Holiday add－on | Y | － |
| Margin adjustment | Rounding on aggregated market－ risk－component margin | Y | － |
|  | Consideration on favorable MTM | － | Y |
|  | Application of margin credit | － | Y |
| Other risk component | MTM requirement | － | Y |
|  | Position limit add－on | － | Y |
|  | Credit risk add－on | － | Y |
|  | Ad－hoc add－on | － | Y |

## 3．1．2 Positions

The following position details of portfolios are required to calculate total MTM and margin requirement：
－InstrumentID（e．g．， 700 for Tencent Holdings）
－Quantity ${ }^{9}$（e．g．－ $1,000,000$ means to deliver 1，000，000 shares）
－Contract value ${ }^{10}$ in HKD equivalent（e．g．，In VaR Platform，－384，000，000 means the CP has a receivable of $\$ 384,000,000$ ）
－Market value ${ }^{11}$ in HKD equivalent
The above information for CPs＇entire portfolios could be retrieved from＂Marginable Position Report＂（＂RMAMP01＂），which will be disseminated to CPs after each margin call and day－end margin estimation process ${ }^{12}$ ．When using the information in the＂Marginable Position Report＂，please note that：

[^2]－For non－HKD denominated instruments，contract values and market values are converted to HKD equivalent using the latest available FX rates without haircut when the position snapshot is captured；
－Positions covered by specific stock／cash collateral are excluded ${ }^{13}$ ；and
－All positions are adjusted for corporate actions ${ }^{14}$ ；and
－All positions are cross－day netted ${ }^{15}$ ．
In addition，users could opt to generate the marginable positions by their own if they would like to calculate margin and marks more frequently during the day．The generation of marginable position will include three main steps：（i）adjustment of specific stock／cash collateral cover，（ii）Corporate Action positions adjustment and（iii）cross－day positions netting．Appendix 4.3 to 4.5 demonstrate the detailed steps for reference．

A sample portfolio is shown below for illustration of calculation in the subsequent section：

| InstrumentID | Quantity | Contract value <br> in HKD Equivalent | Market value <br> in HKD Equivalent |
| :---: | :---: | ---: | ---: |
| 658 | $-10,000,000$ | $-62,000,000$ | $-60,000,000$ |
| 700 | $-1,000,000$ | $-384,000,000$ | $-400,000,000$ |
| 1299 | $1,000,000$ | $80,000,000$ | $80,000,000$ |
| 1876 | 100,000 | $2,700,000$ | $3,000,000$ |
| 2823 | $1,000,000$ | $30,000,000$ | $30,000,000$ |
| 3456 | 10,000 | $1,600,000$ | $1,300,000$ |
| 3457 | $-50,000$ | $-1,200,000$ | $-1,000,000$ |
| 3606 | $1,000,000$ | $28,000,000$ | $30,000,000$ |
| 3690 | 100,000 | $6,900,000$ | $7,000,000$ |
| 26883 | $110,000,000$ | $3,000,000$ | $2,000,000$ |
| DSP700 | $-1,000,000$ | 0 | $-4,000,000$ |
| DIV1299 | $1,000,000$ | $-1,000,000$ | 0 |
| SRI3606 | $2,000,000$ | 0 | $1,000,000$ |
| 60954 | $120,000,000$ | $8,000,000$ | $10,000,000$ |

## 3．2 Calculation Process

## 3．2．1 Overview of the Calculation Process for Total MTM and Margin Requirement

Total MTM and margin requirement is calculated according to the steps as follows：
－Identify applicable market risk components for each instrument in the portfolio （See §3．2．2）；
－Identify margin adjustments and other risk components（See §3．2．3）；
－Calculate market risk components（See §3．2．4）；
－Aggregate market risk components and perform margin adjustments（See §3．2．5）；
－Calculate or retrieve other risk components from report（See §3．2．6）；and
－Derive total MTM and margin requirement by adding results from §3．2．5 \＆§3．2．6 （See §3．2．8）．

[^3]
## 3．2．2 Identify Applicable Market Risk Components for Each Instrument in Portfolio

Users shall identify applicable margin components by using the CP－specific＂Marginable
Position Report＂and＂Initial Margin Risk Parameter File＂according to the steps as follows：
Step 1：Identify all corresponding FieldType（s）in the＂Initial Margin Risk Parameter File＂for each instrument shown in the＂Marginable Position Report＂．

Please note that Instrument Code in the＂Marginable Position Report＂is the same as InstrumentID in the＂Initial Margin Risk Parameter File＂for each tradeable instrument．For corporate action entitled instruments，the instrument code would be decomposed into two fields in FieldType 7 （See §2．2）．

For example，Instrument Code 658 is found in the＂Marginable Position Report＂．Users shall find out＂658＂under the column InstrumentID and identify the corresponding FieldType（s）associated with the instrument in the＂Initial Margin Risk Parameter File＂．In this case，FieldType 3 is identified for the instrument．

For example，a corporate action entitled instrument＂DSP700＂is found in the＂Marginable Position Report＂，users shall find out＂ 700 ＂under the column InstrumentID and＂1＂under the next column in FieldType 7.

After repeating the aforementioned step for each instrument，user should identify the instruments subject to holiday add－on ${ }^{16}$ ．The holiday add－on will apply to all instruments except for those having FieldType 7 （i．e．instruments subject to corporate action position margin）．Finally，the identification result of the sample portfolio is shown as follows：

| Instrument Code／ InstrumentID | Market risk component |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Portfolio margin |  | Flat rate margin | Liquidation risk add－on |  | Structured product add－on | Corporate action position margin | Holiday add－on |
|  | HVaR | SVaR |  |  |  |  |  |  |
|  | FieldType |  |  |  |  |  |  | Holiday ＿factor |
|  | 1 | 2 | 3 | 4 | 5 | 6 | 7 |  |
| 658 | － | － | Y | － | － | － | － | Y |
| 700 | Y | Y | － | Y | － | － | － |  |
| 1299 | Y | Y | － | Y | － | － | － |  |
| 1876 | Y | Y | － | Y | － | － | － |  |
| 2823 | Y | Y | － | Y | － | － | － |  |
| 3456 | － | － | Y | － | － | － | － |  |
| 3457 | － | － | Y | － | － | － | － |  |
| 3606 | － | － | Y | － | － | － | － |  |
| 3690 | Y | Y | － | Y | － | － | － |  |
| 26883 | Y | Y | － | － | Y | Y | － |  |
| DSP700 | － | － | － | － | － | － | Y |  |
| DIV1299 | － | － | － | － | － | － | Y | － |
| SRI3606 | － | － | － | － | － | － | Y |  |

[^4]Step 2：Identify applicable margin components for each instrument by referring to the FieldType definitions stated in §2．2．

For example，users should only include the InstrumentID 658 and 3606 for flat rate margin calculation according to the identification results shown in the above table（see §3．2．4．2 for calculation process on flat rate margin in details）．

## 3．2．3 Identify Margin Adjustments and Other Risk Components

Users shall follow the rules below to determine which instrument should be included in the calculation of other risk components：
－Positions limit add－on applies to all Hong Kong market instruments；and
－Credit risk add－on and ad－hoc add－on are not applicable to any instruments from the Initial Margin Risk Parameter File．Instead，users shall refer to the add－on amounts directly from the＂MTM and Margin Requirement Report＂．

The margin adjustments below are applied on a portfolio basis（See §3．2．8 for details）：
－Rounding on aggregated market－risk－component margin；
－Consideration on favorable MTM；and
－Application of margin credit．

## 3．2．4 Calculate Market Risk Components

## 3．2．4．1 Portfolio Margin

The portfolio margin is the weighted average of the following two components，subject to the portfolio margin floor：
（i）Historical Value－at－Risk（＂HVaR＂）component；and
（ii）Stress Value－at－Risk（＂SVaR＂）component．
For the calculation of（i）and（ii），it is required to treat each IPO ${ }^{17}$ stock and its relevant structured product（s）${ }^{18}$ as an individual portfolio and group other non－IPO related instruments together as another separate portfolio．

## 3．2．4．1．1 Historical Value－at－Risk Component（＂HVaR＂）

HVaR is calculated according to the steps as follows：
Step 1：Calculate the portfolio returns of positions in each scenario under FieldType 1 identified as per instructions in §3．2．2．

For example：
Portfolio return ${ }^{19}$ in scenario 1 for IPO instrument group 1876
$=\left(\right.$ Market value $_{1876} \times$ Return $\left._{1876}\right)$

[^5]\[

$$
\begin{aligned}
& =(3,000,000 \times 0.011128) \\
& =33,384
\end{aligned}
$$
\]

Portfolio return ${ }^{20}$ in scenario 1 for IPO instrument group 3690
$=\left(\right.$ Market value $3690 \times$ Return $\left._{3690}\right)$
$=(7,000,000 \times 0.012241)$
$=85,687$
Portfolio return ${ }^{21}$ in scenario 1 for non－IPO instruments
$=\left(\right.$ Market value $_{700} \times$ Return $\left._{700}\right)+\left(\right.$ Market value $_{1299} \times$ Return $\left._{1299}\right)+\left(\right.$ Market value $_{2823}$
$\times$ Return $\left._{2823}\right)+\left(\right.$ Market value $_{26883} \times$ Return $\left._{26883}\right)+\left(\right.$ Market value $60954 \times$ Return $\left._{60954}\right)$
$=(-400,000,000 \times 0.01391)+(80,000,000 \times 0.01125)+(30,000,000 \times 0.011628)+$ $(2,000,000 \times 0.136461)+(10,000,000 \times-0.104288)$
$=-5,085,118$
Step 2：Repeat step 1 for all HVaR scenarios under FieldType 1 （i．e．，1，000 referring to HVaR＿Scen＿Count in the Initial Margin Risk Parameter File）．

A set of scenario returns under FieldType 1 will be obtained as follows：

| FieldType 1 | Scenario 1 | Scenario 2 | $\cdots$ | Scenario 1，000 |
| :---: | ---: | ---: | ---: | ---: |
| Portfolio return for IPO <br> stock 1876 | 33,384 | $-44,367$ | $\cdots$ | -9 |
| Portfolio return for IPO <br> stock 3690 | 85,687 | $-113,876$ | $\cdots$ | -21 |
| Portfolio return for <br> non－IPO instruments | $-5,805,118$ | $5,202,132$ | $\cdots$ | 6,738 |

Step 3：Calculate HVaR component of the portfolios by averaging the worst 6 scenarios ${ }^{22}$ ，where HVaR＿Measure parameter indicates an ES （Discrete）risk measure，and HVaR＿CL parameter indicates a confidence level of 99．4\％．

HVaR for IPO instrument group $1876=-7,546.5$
HVaR for IPO instrument group $3690=-19,369$
HVaR for non－IPO instruments $=\mathbf{- 4 , 7 9 3 , 8 8 5 . 6 7}$

## 3．2．4．1．2 Stress Value－at－Risk Component（＂SVaR＂）

SVaR is calculated according to the steps as follows：
Step 1：Calculate the portfolio return of positions for each scenario under FieldType 2 identified as per instructions in §3．2．2．

[^6]HKSCC－VaR Platform
香㟟交易所

For example：
Portfolio return ${ }^{23}$ in scenario 1 for IPO instrument group 1876
$=\left(\right.$ Market value $_{1876} \times$ Return $\left._{1876}\right)$
$=(3,000,000 \times 0.040616)$
$=121,848$
Portfolio return ${ }^{24}$ in scenario 1 for IPO instrument group 3690
$=\left(\right.$ Market value $3690 \times$ Return $\left._{3690}\right)$
$=(7,000,000 \times 0.044678)$
$=312,746$
Portfolio return ${ }^{25}$ in scenario 1 for non－IPO instruments
$=\left(\right.$ Market value $_{700} \times$ Return $\left._{700}\right)+\left(\right.$ Market value $_{1299} \times$ Return $\left._{1299}\right)+\left(\right.$ Market value $_{2823}$
$\times$ Return $\left._{2823}\right)+\left(\right.$ Market value $_{26883} \times$ Return $\left._{26883}\right)+\left(\right.$ Market value ${ }_{60954} \times$ Return $\left._{60954}\right)$
$\begin{aligned}= & (-400,000,000 \times 0.041026)+(80,000,000 \times 0.037588)+(30,000,000 \times 0.026217) \\ & +(2,000,000 \times 0.254769)+(10,000,000 \times-0.321378)\end{aligned}$
$+(2,000,000 \times 0.254769)+(10,000,000 \times-0.321378)$
$=-15,321,092$
Step 2：Repeat step 1 for all SVaR scenarios under FieldType 2 （i．e．，1，018 referring to SVaR＿Scen＿Count in the Initial Margin Risk Parameter File）．

A set of scenario returns under FieldType 2 will be obtained as follows：

| FieldType 2 | Scenario 1 | Scenario 2 | $\ldots$ | Scenario 1，018 |
| :---: | ---: | ---: | ---: | ---: |
| Portfolio return for <br> IPO stock 1876 | 121,848 | 228,468 | $\ldots$ | $-166,599$ |
| Portfolio return for <br> IPO stock 3690 | 312,746 | 586,404 | $\ldots$ | $-427,602$ |
| Portfolio return for <br> non－IPO instruments | $-15,321,092$ | $-35,058,992$ | $\ldots$ | $25,818,414$ |

Step 3：Calculate SVaR component of the portfolio is the average of the worst 21 scenarios ${ }^{26}$ ，where SVaR＿Measure parameter indicates an ES （Discrete）risk measure，and SVaR＿CL parameter indicates a confidence level of $98 \%$ ．

SVaR for IPO instrument group $1876=\mathbf{- 2 3 , 5 3 5 . 2 9}$
SVaR for IPO instrument group $3690=\mathbf{- 6 0 , 4 0 7 . 6 7}$
SVaR for non－IPO instruments＝－16，147，985．33

[^7]
## 3．2．4．1．3 Portfolio Margin Floor

Portfolio margin floor is the product of：
（i）Portfolio margin floor base；and
（ii）Portfolio margin floor rate ${ }^{27}$ ．
Where the portfolio margin floor base is the higher of gross long and short market value of positions under FieldType 1 or 2，and the current portfolio margin floor rate is available at HKEX website ${ }^{28}$ ．In this example，the portfolio margin floor rate is set as $2.5 \%$ as an example for illustration of the calculation method．

The portfolio margin floor is calculated according to the steps as follows：

## Step 1：Calculate the portfolio margin floor base．

```
Portfolio margin floor base
\(=\) Maximum [Absolute value of (Market value \({ }_{1299}\) ) + Absolute value of (Market
    value \({ }_{1876}\) ) + Absolute value of (Market value \({ }_{2823}\) ) + Absolute value of (Market
    value 3690 ) + Absolute value of (Market value 26883 ) + Absolute value of (Market
    value \({ }_{60954}\) ), Absolute value of (Market value \({ }_{700}\) )]
\(=\) Maximum \([(80,000,000+3,000,000+30,000,000+7,000,000+2,000,000+\)
10,000,000) , 400,000,000]
\(=\) Maximum [132,000,000 , 400,000,000]
\(=400,000,000\)
```

Step 2：Calculate portfolio margin floor by applying the 2．5\％margin floor rate to the base．

Portfolio margin floor
$=$ Portfolio margin floor base $\times$ Portfolio margin floor rate
$=400,000,000 \times 2.5 \%$
$=10,000,000$

## As a result，the portfolio margin will be：

Portfolio margin ${ }^{29}$
＝Maximum［Sum of（HVaR x HVaR＿WGT＋SVaR x SVaR＿WGT），Portfolio margin floor］
$=$ Maximum［Absolute value of $((-7,546.5 \times 75 \%)+(-23,535.29 \times 25 \%)+(-19,369 \times 75 \%)$ $+(-60,407.67 \times 25 \%)+(-4,793,885.67 \times 75 \%)+(-16,147,985.33 \times 25 \%)), 10,000,000]$
$=$ Maximum［Absolute value of $((-11,543.70)+(-29,628.67)+(-7,632,410.59))$ ， 10，000，000］
$=\underline{10,000,000}$

[^8]
## 3．2．4．2 Flat Rate Margin

Flat rate margin is calculated according to the steps as follows：
Step 1：Aggregate absolute market value of long positions and absolute market value of short positions separately for each position identified as per instructions in §3．2．2．and compare the total absolute market value of long positions and short positions separately for each sub－category of flat rate margin calculation defined on HKEX website ${ }^{30}$ ．

For example：
Sub－category 1 positions

| InstrumentID | Quantity | Absolute market value <br> of long positions <br> in HKD equivalent | Absolute market value <br> of short positions <br> in HKD equivalent |
| :---: | :---: | ---: | ---: |
| 3457 | $<0$ | 0 | $1,000,000$ |
| 3456 | $\geq 0$ | $1,300,000$ | 0 |
| Total |  | $\mathbf{1 , 3 0 0 , 0 0 0}$ | $\mathbf{1 , 0 0 0 , 0 0 0}$ |

For the sub－category 1 positions above，the total absolute long market value is higher than the total absolute short market value．Therefore，all long sub－category 1 positions will be included in the flat rate margin calculation while all short sub－category 1 positions will be excluded．

| InstrumentID | Quantity | Contract value <br> in HKD Equivalent | Market value <br> in HKD Equivalent |
| :---: | :---: | :---: | :---: |
| 3456 | 10,000 | $1,600,000$ | $1,300,000$ |

Sub－category 2 positions

| InstrumentID | Quantity | Absolute market value <br> of long positions <br> in HKD equivalent | Absolute market value <br> of short positions <br> in HKD equivalent |
| :---: | :---: | ---: | ---: |
| 658 | $<0$ | 0 | $60,000,000$ |
| 3606 | $\geq 0$ | $30,000,000$ | 0 |
| Total |  | $30,000,000$ | $60,000,000$ |

For the sub－category 2 positions above，the total absolute short market value is higher than the total absolute long market value．Therefore，all short sub－category 2 positions will be included in the flat rate margin calculation while all long sub－category 2 positions will be excluded．

| InstrumentID | Quantity | Contract value <br> in HKD Equivalent | Market value <br> in HKD Equivalent |
| :---: | :---: | :---: | :---: |
| 658 | $-10,000,000$ | $-62,000,000$ | $-60,000,000$ |

Step 2：Sum the product of absolute position market value and the flat margin rate under FieldType 3.

Step 3：Apply flat rate margin multiplier ${ }^{31}$ by referring to the＂Daily Participant Margin Multiplier Report＂（＂DWH0081C＂）to obtain the flat rate margin after margin multiplier．

[^9]For example，assume a flat rate margin multiplier of 2 is assigned，
Flat rate margin after applying margin multiplier
$=(1,300,000 \times 30 \%+60,000,000 \times 12 \%) \times 2$
$=\underline{\underline{15,180,000}}$

## 3．2．4．3 Liquidation Risk Add－on（＂LRA＂）

LRA is consisted of two components identified as per instructions in §3．2．2：
－Instrument－level LRA；and
－Portfolio－level LRA．

## 3．2．4．3．1 Instrument－level LRA

Instrument－level LRA is calculated according to the steps as follows：
Step 1：Calculate the delta－equivalent position market values for each underlying group．Users could find out the underlying group of a particular structured product by referring to the first column on the right of＂FieldType $=5$＂in the Initial Margin Risk Parameter File．

Taking Instrument 26883 as an example，users could refer to the Initial Margin Risk Parameter File and locate Instrument 700 is its corresponding underlying group．

Similarly，the underlying stock for Instrument 60954 is Instrument 1299.
In case the users only hold the stock without the corresponding structured product （i．e．，no information of that particular instrument under FieldType 5），the users shall calculate the market value of delta－equivalent position by using the information under FieldType 4.

See the treatment of instruments $1876,2823,3690$ in the example as follows：

| InstrumentID | Quantity <br> （A） | Cash delta per quantity (B) | Market value of delta equivalent position in HKD equivalent $(C)=(A) \times(B)$ |
| :---: | :---: | :---: | :---: |
| 700 | －1，000，000 | 400 | －400，000，000 |
| 26883 | 110，000，000 | 0.1784 | 19，624，000 |
| Total for the underlying group 700 |  |  | －380，376，000 |
| 1299 | 1，000，000 | 80 | 80，000，000 |
| 60954 | 120，000，000 | －0．63167 | －75，800，400 |
| Total for the underlying group 1299 |  |  | 4，199，600 |
| 1876 | 100，000 | 30 | 3，000，000 |
| Not applicable |  |  | 0 |
| Total for the underlying group 1876 |  |  | 3，000，000 |
| 2823 | 1，000，000 | 30 | 30，000，000 |
| Not applicable |  |  | 0 |
| Total for the underlying group 2823 |  |  | 30，000，000 |
| 3690 | 100，000 | 70 | 7，000，000 |
| Not applicable |  | ， | 0 |

香 㟟交易所
HKSCC－VaR Platform
Initial Margin Calculation Guide

Step 2：Calculate the instrument－level LRA based on the respective bucket rates and the portion of delta－equivalent position market value which exceeds the thresholds for each underlying group and subsequently aggregate the LRAs for all underlying groups shown as follows：

| Underlying <br> Group | Market value of <br> delta equivalent <br> position <br> in HKD equivalent <br> （A） | Threshold <br> In HKD <br> equivalent <br> （B） | Bucket <br> rate <br> （C） | Liquidation risk add－on <br> （D） <br> ＝Maximum［Absolute <br> value of（（A））－（B），0］x（C） |
| :---: | ---: | ---: | ---: | ---: |
| 700 | $-380,376,000$ | $300,000,000$ | 0.0022 | $176,827.2$ |
| 1299 | $4,199,600$ | $100,000,000$ | 0.0025 | 0 |
| 1876 | $3,000,000$ | $200,000,000$ | 0.002 | 0 |
| 2823 | $30,000,000$ | $250,000,000$ | 0.002 | 0 |
| 3690 | $7,000,000$ | $300,000,000$ | 0.0022 | 0 |
| Total |  |  |  | $\mathbf{1 7 6 , 8 2 7 . 2}$ |

Instrument－level LRA＝176，827（rounded off to the nearest integer）

## 3．2．4．3．2 Portfolio－level LRA

Portfolio－level LRA is calculated according to the steps as follows：
Step 1：Calculate market values of beta hedge positions for each of the underlying groups and subsequently aggregate the results．

| Underlying group | Market value of delta equivalent position in HKD Equivalent <br> （A） | Beta <br> （B） | Market value of beta hedge position（C） $=(A) \times(B)$ |
| :---: | :---: | :---: | :---: |
| 700 | －380，376，000 | 0.9 | －342，338，400 |
| 1299 | 4，199，600 | 1.1 | 4，619，560 |
| 1876 | 3，000，000 | 1.2 | 3，600，000 |
| 2823 | 30，000，000 | 1 | 30，000，000 |
| 3690 | 7，000，000 | 1.3 | 9，100，000 |
| Total |  |  | －295，018，840 |

Step 2：Calculate portfolio－level LRA with the aid of a portfolio hedging instrument．

The sample portfolio＇s hedging instrument is currently set as the Tracker Fund of Hong Kong（2800．HK）${ }^{32}$ ．

Hedging market value threshold $=250,000,000$
Hedging instrument bucket rate $=0.002$
Portfolio－level liquidation risk add－on
＝Maximum［ 0 ，Absolute value of（Total market value of beta hedge position）－
Hedging market value threshold］x Hedging instrument bucket rate

[^10]\[

$$
\begin{aligned}
& =\text { Maximum }[0,(295,018,840-250,000,000)] \times 0.002 \\
& =90,038 \text { (rounded off to the nearest integer) }
\end{aligned}
$$
\]

As a result，the liquidation risk add－on will be：
LRA
$=$ Instrument－level LRA + Portfolio－level LRA
$=176,827+90,038$
$=\underline{\underline{\mathbf{2 6} 6,865}}$

## 3．2．4．4 Structured Product Add－on

Structured product add－on includes structured products which
－The instrument market prices are smaller than their corresponding price thresholds （i．e．，all instruments listed under FieldType 6 as per instruction in §3．2．2）；and
－The instruments are under long positions．
Structured product add－on is calculated according to the steps as follows：

## Step 1：Identify the position of all instruments under FieldType 6.

In the sample portfolio，InstrumentID 26883 is identified under FieldType 6 as per the table shown in §3．2．2．

As there is a positive quantity of InstrumentID 26883 （i．e．， $110,000,000$ ），the instrument is under long position and should be included in the subsequent calculation for structured product add－on ${ }^{33}$ ．

Step 2：Calculate the structured product add－on by using the formula as follows：

$$
=\text { Quantity } \mathrm{x} \text { Tick size multiplier }{ }^{34} \mathrm{x} \text { Minimum tick size }{ }^{35}
$$

The calculation process is shown as follows：

| InstrumentID | Quantity <br> $(\mathbf{A})$ | Tick size <br> multiplier <br> $(B)$ | Minimum tick size <br> $(\mathbf{C})$ | Structured <br> product add－on <br> （D） <br> $=(A) \times(B) \times(C)$ |
| :---: | :---: | :---: | :---: | :---: |
| 26883 | $110,000,000$ | 5 | 0.001 | 550,000 |
| Total |  |  |  | $\underline{550,000}$ |

## 3．2．4．5 Corporate Action Position Margin

Corporate action position margin is calculated according to the steps as follows：
Step 1：Calculate the net market value of positions for each scenario under FieldType 7 identified as per instructions in §3．2．2．

[^11]The result of sample portfolio is shown as follows：

| InstrumentID | Quantity | Contract value <br> in HKD equivalent <br> $(\mathbf{A})$ | Market value <br> in HKD equivalent <br> $(\mathbf{B})$ | Net market value <br> $(\mathbf{C})=(\mathbf{B})-(\mathbf{A})$ |
| :---: | :---: | ---: | ---: | ---: |
| DSP700 | $<0$ | 0 | $-4,000,000$ | $-4,000,000$ |
| DIV1299 | $\geq 0$ | $-1,000,000$ | 0 | $1,000,000$ |
| SRI3606 | $\geq 0$ | 0 | $1,000,000$ | $1,000,000$ |

Step 2：Apply positive net market value positions to scenario 4 under FieldType 7.

## Step 3：Apply negative net market value positions to scenario 3 under FieldType 7.

Step 4：Add the results obtained from steps 2 and 3.
Corporate Action Position Margin ${ }^{36}$
$=$ Absolute value of（net market value ${ }_{\text {DSP700 }}$ ）$\times$ scenario $3+$ Absolute value of（net market value $_{\text {Div1299 }}$ ） scenario 4 ＋Absolute value of（net market value ${ }_{\text {sRi3606 }}$ ）$\times$ scenario 4
$=$ Absolute value of $(-4,000,000 \times-0.5)+$ Absolute value of $(1,000,000 \times 0)+$ Absolute value of $(1,000,000 \times 0.5)$
$=\underline{\underline{2,500,000}}$

## 3．2．4．6 Holiday Add－on ${ }^{37}$

Holiday add－on only includes positions subject to portfolio margin or flat rate margin identified as per instructions in §3．2．2．

Holiday add－on is calculated according to the steps as follows：
Step 1：Calculate the base of holiday add－on by adding portfolio margin to flat rate margin．

Base of holiday add－on
$=$ Portfolio margin + Flat rate margin
$=10,000,000+15,180,000$
$=25,180,000$
Step 2：Calculate holiday add－on by multiplying the base of holiday add－on by Holiday＿Factor parameter ${ }^{38}$ ．

Holiday add－on
$=$ Base of holiday add－on x 0.7320508075
$=25,180,000 \times 0.7320508075$

[^12]$=\underline{\underline{18,433,039}}$（rounded off to the nearest integer）

## 3．2．5 Aggregate Market Risk Components and Perform Margin Adjustments

The market risk components are aggregated with margin adjustments as follows：
－Rounding on aggregated market－risk－component margin
－Consideration on favourable MTM ${ }^{39}$
－Application of margin credit

## 3．2．5．1 Rounding on Aggregated Market－risk－component Margin

Margin rounding is performed on all market risk components according to the steps as follows：

## Step 1：Calculate aggregated margin derived from market risk components．

Aggregated market－risk－component margin
$=$ Portfolio margin + Flat rate margin + Liquidation risk add－on＋Structured product add－ on＋Corporate action position margin＋Holiday add－on
$=10,000,000+15,180,000+266,865+550,000+2,500,000+18,433,039$
$=46,929,904$

## Step 2：Round up the aggregated margin with reference to the rounding parameter stated in the Initial Margin Risk Parameter File（e．g．，10，000 in the sample Initial Margin Risk Parameter File）．

In our example，46，929，904 is to be rounded up to the nearest 10,000 ．
Rounded aggregated market－risk－component margin $=\underline{\underline{46,930,000}}$

## 3．2．5．2 Consideration on Favorable MTM

Favorable MTM（or MTM requirement）${ }^{40}$ could be determined by the steps as follows：
Step 1：Calculate favorable MTM（or MTM requirement）by using the formula as follows：

Favorable MTM（or MTM requirement）${ }^{41}$
$=$ Market value Porttolio －Contract value Portfolio
$=(-300,700,000)-(-288,000,000)$
$=\underline{\underline{-12,700,000}}$
The negative number refers to a MTM requirement，which its absolute value will be added after applying margin credit（See §3．2．6．1）．In such case，favorable MTM is zero．

[^13]
## Step 2：Deduct favorable MTM from rounded aggregated market－risk－component margin to derive net margin．

Net margin
＝Maximum（ 0 ，Rounded aggregated market－risk－component margin－Favorable MTM）
$=$ Maximum $[0,(46,930,000-0)]$
$=\underline{46,930,000}$

## 3．2．5．3 Application of Margin Credit

A margin credit（normally $5,000,000)^{42}$ is granted to each CP and applied for margin calculation ${ }^{43}$ ．

Net margin after credit is calculated as follows：
Net margin after credit
＝Maximum［0，（Net margin－Margin credit）］
$=$ Maximum［0 ，（46，930，000－5，000，000）］
$=\underline{41,930,000}$

## 3．2．6 Calculate or Retrieve Other Risk Components from Report

## 3．2．6．1 MTM Requirement ${ }^{44}$

In our example，a MTM requirement of $\mathbf{1 2 , 7 0 0 , 0 0 0}$ is figured out as per §3．2．5．2．

## 3．2．6．2 Position Limit Add－on

Position limit add－on is applicable to all non－custodian CPs（See §4．1 for detailed calculation）．CPs could refer to the＂MTM and Margin Requirement Report＂for the amount of positions limit add－on to be charged．

For illustration purpose，position limit add－on for the sample portfolio is assumed to be 490，481．

## 3．2．6．3 Credit Risk Add－on ${ }^{45}$

Credit risk add－on is only applicable to specific CPs who will be notified by HKSCC individually．Those CPs could refer to the＂MTM and Margin Requirement Report＂for the amount to be charged．

For illustration purpose，credit risk add－on for the sample portfolio is assumed to be 12，000，000．

[^14]
## 3．2．6．4 Ad－hoc Add－on

Ad－hoc add－on is only applicable to specific CPs who will be notified by HKSCC individually．Those CPs could refer to the＂MTM and Margin Requirement Report＂for the amount to be charged．

For illustration purpose，ad－hoc add－on for the sample portfolio is assumed to be $\underline{\underline{\mathbf{6 0 0}, 000}}$ ．

## 3．2．7 Summary of Market Risk Components with Margin Adjustments and Other Risk

 Components| Market risk components | Results <br> in HKD equivalent |  |
| :---: | :---: | ---: |
|  | Portfolio margin | $10,000,000$ |
|  | Flat rate margin | $15,180,000$ |
|  | Liquidation risk add－on | 266,865 |
|  | Structured product add－on | 550,000 |
|  | Corporate action position margin | $2,500,000$ |
| Other risk components | Holiday add－on | $18,433,039$ |
| Margin adjustments | Net margin after credit | $46,929,904$ |
|  | MTM requirement | $41,930,000$ |
|  | Position limit add－on | $12,700,000$ |
|  | Credit risk add－on | 490,481 |
|  | Ad－hoc add－on | $12,000,000$ |

## 3．2．8 Derive Total MTM and Margin Requirement from Results under §3．2．5 \＆§3．2．6

Eventually，total MTM and margin requirement could be derived by adding the net margin after credit to other risk components．

Total MTM and margin requirement
$=$ Net margin after credit + Other risk components
＝Net margin after credit＋MTM requirement＋Position limit add－on＋Credit risk add－on＋ Ad－hoc add－on
$=41,930,000+12,700,000+490,481+12,000,000+600,000$
$=\underline{67,720,481}$

## 4．APPENDIX

## 4．1 Detailed Calculation on Position Limit Add－on

Position limit add－on assumes hypothetical conditions as follows：
－Apportioned liquid capital of $C P=75,000,000$
－Apportioned liquid capital multiplier ${ }^{46}=4$
－Apportioned liquid capital cap ${ }^{47}=280,000,000$
－Rounded aggregated market－risk－component margin $=46,930,000$
－Net margin after credit $=41,930,000$
－Add－on $\%^{48}=25 \%$
Position limit add－on is calculated according to the steps as follows：
Step 1：Sum the market values in HKD equivalent of all positions in the portfolio as follows：

| InstrumentlD | Market value in HKD equivalent |
| :---: | ---: |
| 658 | $-60,000,000$ |
| 700 | $-400,000,000$ |
| 1299 | $80,000,000$ |
| 1876 | $3,000,000$ |
| 2823 | $30,000,000$ |
| 3456 | $1,300,000$ |
| 3457 | $-1,000,000$ |
| 3606 | $30,000,000$ |
| 3690 | $7,000,000$ |
| 26883 | $2,000,000$ |
| DSP700 | $-4,000,000$ |
| DIV1299 | 0 |
| SRI3606 | $1,000,000$ |
| 60954 |  |
| Total | $-300,700,000$ |

Step 2：Calculate net market value（＂NMV＂）of the portfolio by taking absolute value in case of net short position．

NMV $=$ Absolute value of $(-300,700,000)=300,700,000$

## Step 3：Calculate position limit add－on by using the formula as follows：

## Position limit add－on

＝If（NMV＝0， 0 ，Maximum \｛NMV－Minimum［（Apportioned liquid capital x Apportioned liquid capital multiplier），Apportioned liquid capital cap］，0\} / NMV x Round up(Portfolio margin + Flat rate margin＋Corporate action position margin＋Liquidation risk add－on＋Structured

[^15]product add－on，Rounding parameter in the IMRPF）x If（Net margin after credit＞0，Add－on\％， 1＋Add－on\％））
$=$ Maximum \｛300，700，000 - Minimum［（75，000，000 x 4），280，000，000］，0\} / 300,700,000 x Round up（ $28,496,865,10,000) \times 25 \%$
$=$ Maximum［（300，700，000－280，000，000），0］／300，700，000 x 28，500，000 $\times 25 \%$
$=$ Maximum $(20,700,000,0) / 300,700,000 \times 28,500,000 \times 25 \%$
$=490,481$（rounded off to the nearest integer for decimal numbers）

## 4．2 Guarantee Fund Risk Collateral

Guarantee Fund risk collateral，a．k．a．default fund add－on，in the amount of net projected loss of the CP in excess of $50 \%$ of the Guarantee Fund threshold will be collected from the concerned CPs should the Guarantee Fund threshold be reached．Please note that it will not be aggregated to total MTM and margin requirement．

Definition refer to CCASS Operational Procedures $\S 10.11$ is as follows：
Guarantee Fund risk collateral
$=$ Guarantee Fund expected uncollateralised loss ${ }^{49}$－Guarantee Fund risk predefined limit ${ }^{50}$
The calculation result could be found under the field＂Default Fund Add－on＂in the＂MTM and Margin Requirement Report＂．

## 4．3 Specific Stock／Cash Collateral Position Cover

Positions covered by Specific Stock Collateral（＂SSC＂）or Specific Cash Collateral（＂SCC＂）shall be excluded from the MTM and margin requirement calculation．Please note that SSC and SCC could only be arranged to cover positions prior to the settlement date（i．e．，Current business date ＜Settlement date）and capped by the position quantity／position amount．Any excess collateral ${ }^{51}$ will be ignored．

## 4．3．1 Specific Stock Collateral for Short Position

SSC are pledged in CCMS according to corresponding stock code and settlement date． Position cover follows the same manner．

Supposing a CP holds short positions with Quantity＜ 0 on 5 Nov 2019：
Current business date：05－Nov－2019

| Trade date | Settlement date | Stock code | Quantity | Amount |
| :---: | :---: | :---: | :---: | :---: |
| 04－Nov－2019 | 06－Nov－2019 | 5 | $-4,000$ | $-240,000$ |
| 01－Nov－2019 | 05－Nov－2019 | 388 | $-1,500$ | $-360,000$ |
| 04－Nov－2019 | 06－Nov－2019 | 700 | $-1,000$ | 30,000 |
| 05－Nov－2019 | 07－Nov－2019 | 5 | $-2,000$ | $-120,000$ |

[^16]Supposing the CP tries to pledge a quantity of $\mathbf{1 , 5 0 0}$ for each of the stocks as per the same settlement date as SSC，the resulting uncovered positions are shown as follows：

Current business date：05－Nov－2019

| Trade date | Settlement date | Stock <br> code | Quantity | Amount | Remarks |
| :---: | :---: | :---: | :---: | :---: | :--- |
| 04－Nov－2019 | 06－Nov－2019 | 5 | $-2,500$ | $-150,000$ | Pro－rata reduction on amount <br> based on covered quantity |
| 01－Nov－2019 | 05－Nov－2019 | 388 | $-1,500$ | $-360,000$ | Not allowed to be covered as <br> SSC is arranged on Settlement <br> Date |
| 04－Nov－2019 | 06－Nov－2019 | 700 | 0 | 0 | The position is fully covered． <br> Excess collateral is ignored． |
| 05－Nov－2019 | 07－Nov－2019 | 5 | -500 | $-30,000$ | Pro－rata reduction on amount <br> based on covered quantity |

In case of a half trading day（e．g． 24 Dec 2019），for each stock，there could be 2 positions with different trade dates but having the same settlement date．

If both the positions have quantity $<0$ ，then the position with higher position average price will be covered first（i．e．，Position average price＝Absolute value of（Amount／Quantity））

Nevertheless，if there are two positions，one with quantity＞ 0 while the other one with quantity $<0$ ，only the one with quantity $<0$ will undergo the position cover before cross－day position netting．

An example of a CP holds some positions traded on different dates but with the same settlement date：

Current business date：24－Dec－2019

| Trade date | Settlement date | Stock code | Quantity <br> $(\mathbf{A})$ | Amount <br> $(\mathbf{B})$ | Average price <br> $(\mathbf{C})=\mathbf{A b s}(\mathbf{B}) /(\mathbf{A}))$ |
| :---: | :---: | :---: | :---: | :---: | ---: |
| 23－Dec－2019 | 30－Dec－2019 | 5 | $-4,000$ | $-240,000$ | 60 |
| 24－Dec－2019 | 30－Dec－2019 | 5 | 2,000 | 126,000 | 63 |
| 23－Dec－2019 | 30－Dec－2019 | 700 | $-1,000$ | $-330,000$ | 330 |
| 24－Dec－2019 | 30－Dec－2019 | 700 | $-2,000$ | $-720,000$ | 360 |

Supposing the CP tries to pledge a quantity of $\underline{2,500}$ for each of the stocks as per the same settlement date as SSC，the resulting uncovered positions are shown as follows：

Current business date：24－Dec－2019

| Trade date | Settlement date | Stock <br> code | Quantity | Amount | Remarks |
| :---: | :---: | :---: | :---: | :---: | :--- |
| 23－Dec－2019 | 30－Dec－2019 | 5 | $-1,500$ | $-90,000$ | Pro－rata reduction on amount <br> based on covered quantity |
| 24－Dec－2019 | 30－Dec－2019 | 5 | 2,000 | 126,000 | SSC is not accepted as <br> quantity $>0$ |
| 23－Dec－2019 | 30－Dec－2019 | 700 | -500 | $-165,000$ | Because of the lower position <br> average price，this position is <br> covered by the remaining <br> SSC in the quantity of 500． <br> Pro－rata reduction on amount <br> based on covered quantity． |
| 24－Dec－2019 | 30－Dec－2019 | 700 | 0 | Because of the higher <br> position average price，this <br> position is firstly covered by <br> the SSC in the quantity of <br> $2,500$. |  |

|  |  |  | The position is fully covered． <br> Excess collateral（i．e．，500）is <br> ignored． |
| :--- | :--- | :--- | :--- | :--- | :--- |

The resulting positions after SSC position cover will be used for deriving the marginable position for MTM and margin requirement calculation．

## 4．3．2 Specific Cash Collateral Position Cover

SCC are arranged in CCMS according to corresponding stock code and trade date． Position cover follows the same manner．

Supposing a CP holds some long positions with Quantity＞ 0 and Amount＞ 0 on 5 Nov 2019：

Current business date：05－Nov－2019

| Trade date | Settlement date | Stock code | Quantity | Amount |
| :---: | :---: | :---: | :---: | :---: |
| 04－Nov－2019 | 06－Nov－2019 | 5 | 4,000 | 240,000 |
| 01－Nov－2019 | 05－Nov－2019 | 388 | 1,500 | 360,000 |
| 04－Nov－2019 | 06－Nov－2019 | 700 | 100 | 30,000 |
| 05－Nov－2019 | 07－Nov－2019 | 5 | 2,000 | 180,000 |

Supposing the CP tries to arrange $\$ \mathbf{6 0 , 0 0 0}$ for each of the stocks as per the same trade date as SCC，the resulting uncovered positions are shown as follows：

Current business date：05－Nov－2019

| Trade ate | Settlement date | Stock <br> code | Quantity | Amount | Remarks |
| :---: | :---: | :---: | :---: | :---: | :--- |
| 04－Nov－2019 | 06－Nov－2019 | 5 | 3,000 | 180,000 | Pro－rata reduction on <br> Quantity based on covered <br> Amount |
| 01－Nov－2019 | 05－Nov－2019 | 388 | 1,500 | 360,000 | Not allowed to be covered as <br> SCC is arranged on <br> Settlement Date |
| 04－Nov－2019 | 06－Nov－2019 | 700 | 0 | 0 | The position is fully covered． <br> Excess collateral is ignored． |
| 05－Nov－2019 | 07－Nov－2019 | 5 | 1,334 | 120,000 | Pro－rata reduction on <br> Quantity based on covered <br> Amount |

The resulting positions after SCC position cover will be used for deriving the marginable position for MTM and margin requirement calculation．

## 4．4 Corporate Action Position Adjustment

When an instrument（a stock）undergoes corporate action（s），it is possible that some benefit entitlements would be distributed to the CPs（shareholders）or would cause a change in number of shares．The market price of the instrument would react to such kind of corporate actions since the ex－date and therefore the original traded positions should be adjusted to capture the changes．It is also possible that more than one corporate action will appear for the same instrument on the different ex－dates．In this case，each corporate action shall be adjusted separately according the trade date of the position．

There are five types of corporate actions that require position adjustment ${ }^{52}$ ：
－Bonus share／Stock split／Stock consolidation
－Cash dividend
－Stock dividend
－Rights issue／Open offer
－Stock conversion
A＂Corporate Action Position Adjustment Report＂will be generated in csv format and could be downloaded by CPs on each business day ${ }^{53}$ ．The layout of the file is shown below：

| Business Date | Ex－Date | Market | Instrument Code | Converted Instrument Code | Quantity Conversion Ratio | Instrume nt Code for Cash Dividend | Cash Dividend Amount | Instrume nt Code for Stock Dividend | Entitled Stock Quantity | Instrum ent Code for Rights | Rights Quantity |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 05／11／2019 | 05／11／2019 | HKMK | 5 | 5 | 2 | DIV5 | －0．78 | DSP5 | 0.13 | SRI5 | 1.5 |
| 05／11／2019 | 05／11／2019 | HKMK | 8359 | 150 | 1 |  |  |  |  |  |  |

Corporate Action Position Adjustment Report specification：

| Field Name | Description | Format |
| :---: | :---: | :---: |
| Business Date | Report generation date | DD／MM／YYYY |
| Ex－Date | Market ex－date of the corporate action．Only the positions traded before ex－date will be subject to corporate action adjustment | YYYYMMDD |
| Market | Market of the instrument | TEXT（30） |
| Instrument Code | Instrument identifier for the corporate action announcement stock | TEXT（20） |
| Converted Instrument Code | Instrument identifier for the corporate action announcement stock after the corporate action that would change Instrument Code or position quantity | TEXT（10） |
| Quantity Conversion Ratio | Position quantity conversion ratio used for Bonus share <br> ／Stock split／Stock consolidation／Stock conversion． | DECIMALS（X，10）； <br> e．g．，a value of 2 means every 1 position quantity held before the corporate action will be adjusted to 2 after the corporate action |
| Instrument Code for Cash Dividend | Instrument identifier for cash dividend | TEXT（23）； <br> e．g．a label of DIV5 means a cash dividend distributed by the stock of instrument code 5 |
| Cash Dividend Amount | Cash dividend amount in HKD equivalent | DECIMALS（X，10）； <br> e．g．，a value of -0.78 means every 1 position quantity held before the corporate action will be entitled to HKD 0.78 cash dividend |
| Instrument Code for Stock Dividend | Instrument identifier for stock dividend | TEXT（23）； e．g．a label of DSP5 means a stock dividend distributed by the stock of instrument code 5 |
| Entitled Stock Quantity | Entitled stock quantity | DECIMALS（X，10）； <br> e．g．，a value of 0.13 means every 1 position quantity held before the corporate action |

[^17]|  |  | will be entitled to 0．13 quantity <br> of the stock dividend |
| :--- | :--- | :--- |
| Instrument Code for <br> Rights | Instrument identifier for Rights issue／Open offer | TEXT（23）； <br> e．g．a label of SRI5 means a <br> rights issue distributed by the <br> stock of instrument code 5 |
| Rights Quantity | Rights quantity | DECIMALS（X，10）； <br> e．g．，a value of 1.5 means <br> every 1 position quantity held <br> before the corporate action <br> will be entitled to 1.5 quantity <br> of the rights issue |

## 4．4．1 Position Quantity Adjustment for Bonus Share／Stock Split／Stock Consolidation

Supposing there is a bonus share／stock split／stock consolidation shown in the Corporate Action Position Adjustment Report：

| Business Date | Ex－Date | Market | Instrument Code （A） | Converted Instrument Code （B） | Quantity Conversion Ratio （C） | Instrument Code for Cash Dividend （D） | Cash Dividend Amount （E） | Instrument Code for Stock Dividend （F） | Entitled Stock Quantity <br> （G） | Instrument Code for Rights （H） | Rights Quantity <br> （I） |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 05／11／2019 | 05／11／2019 | HKMK | 5 | 5 | 2 |  |  |  |  |  |  |

Note：Please repeat the position adjustment if more than one corporate actions with different ex－dates for the same instrument are required．

Supposing a CP trades instrument（stock）with corporate action announcement，the original traded positions before corporate action adjustment is shown below：

| Trade date | Instrument code <br> $(\mathbf{X})$ | Quantity <br> $(\mathbf{Y})$ | Contract value <br> $(\mathbf{Z})$ |  |
| :---: | :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 5 | 400 | 24,000 |  |
| $05 / 11 / 2019$ | 5 | -600 | $-20,000$ |  |

Only the position traded before ex－date is subject to the position quantity adjustment．For positions that require the adjustment，the new position quantity after adjustment will be equal to the original position quantity times the quantity conversion ratio．The contract value remains unchanged．
i．e．the positions after corporate action adjustment will be：

| Trade date | Instrument code | Quantity | Contract value |
| :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 5 | 800 | 24,000 |
| $05 / 11 / 2019$ | from $(B)$ | from $(Y) \times(C)$ | $-20,000$ |

## 4．4．2 Create Benefit Entitlement Position for Cash Dividend

Supposing there is a cash dividend shown in the Corporate Action Position Adjustment Report：

| Business <br> Date | Ex－Date | Market | Instrument <br> Code <br> （A） | Converted <br> Instrument <br> Code <br> （B） | Quantity <br> Conversion <br> Ratio <br> （C） | Instrument <br> Code for <br> Cash <br> Dividend <br> （D） | Cash <br> Dividend <br> Amount <br> （E） | Instrument <br> Code for <br> Stock <br> Dividend <br> （F） | Entitled <br> Stock <br> Quantity <br> （G） | Instrument <br> Code for <br> Rights <br> （H） |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $05 / 11 / 2019$ | $05 / 11 / 2019$ | HKMK | 5 |  |  | DIV5 | -0.78 |  |  |  |
| Rights <br> Quantity <br> （I） |  |  |  |  |  |  |  |  |  |  |

Note：Please repeat the position adjustment if more than one corporate actions with different ex－dates for the same instrument are required．

Supposing a CP trades instrument（stock）with corporate action announcement，the original traded positions before corporate action adjustment is shown below：

| Trade date | Instrument code <br> $(\mathbf{X})$ | Quantity <br> $(\mathbf{Y})$ | Contract value <br> $(\mathbf{Z})$ |  |
| :---: | :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 5 | 400 | 24,000 |  |
| $05 / 11 / 2019$ | 5 | -600 | $-20,000$ |  |

Only the position traded before ex－date is required to create the benefit entitlement position． To create the cash dividend position，the instrument code will be the Cash Dividend Code． The position quantity will be set as 0 ．The contract value will be equal to the original stock position quantity times the cash dividend amount．
i．e．the positions after corporate action adjustment will be：

| Trade date | Instrument code | Quantity | Contract value |
| :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 5 | 400 | 24,000 |
| $04 / 11 / 2019$ | DIV5 | 0 | -312 |
| $05 / 11 / 2019$ | 5 | set $2 s 0$ for $D I V$ | from $(Y) \times(E)$ |

## 4．4．3 Create Benefit Entitlement Position for Stock Dividend

Supposing there is a stock dividend shown in the Corporate Action Position Adjustment Report：

| Business Date | Ex－Date | Market | Instrument Code （A） | Converted Instrument Code （B） | Quantity Conversion Ratio （C） | Instrument Code for Cash Dividend （D） | Cash Dividend Amount （E） | Instrument Code for Stock Dividend （F） | Entitled Stock Quantity <br> （G） | Instrument Code for Rights （H） | Rights Quantity （I） |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 05／11／2019 | 05／11／2019 | HKMK | 5 |  |  |  |  | DSP5 | 0.13 |  |  |

Note：Please repeat the position adjustment if more than one corporate actions with different ex－dates for the same instrument are required．

Supposing a CP trades instrument（stock）with corporate action announcement，the original traded positions before corporate action adjustment is shown below：

| Trade date | Instrument code <br> $(\mathbf{X})$ | Quantity <br> $(\mathbf{Y})$ | Contract value <br> $(\mathbf{Z})$ |  |
| :---: | :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 5 | 400 | 24,000 |  |
| $05 / 11 / 2019$ | 5 | -600 | $-20,000$ |  |

Only the position traded before ex－date is required to create the benefit entitlement position． To create the stock dividend position，the instrument code will be the Stock Dividend Code． The position quantity will be equal to the original stock position quantity times the entitled stock quantity．The contract value will be set as 0 ．
i．e．the positions after corporate action adjustment will be：

| Trade date | Instrument code | Quantity | Contract value |
| :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 5 | 400 | 24,000 |
| $04 / 11 / 2019$ | DSP5 | 52 | 0 |

| $05 / 11 / 2019$ | 5 | -600 | 20,000 |
| :---: | :---: | :---: | :---: |

## 4．4．4 Create Benefit Entitlement Position for Rights Issue／Open Offer

Supposing there is a rights issue／open offer shown in the Corporate Action Position Adjustment Report：

| Business <br> Date | Ex－Date | Market | Instrument <br> Code <br> （A） | Converted <br> Instrument <br> Code <br> （B） | Quantity <br> Conversion <br> Ratio <br> （C） | Instrument <br> Code for <br> Cash <br> Dividend <br> （D） | Cash <br> Dividend <br> Amount <br> （E） | Onstrument <br> Code for <br> Stock <br> Dividend <br> （F） | Entitled <br> Stock <br> Quantity <br> （G） | Instrument <br> Code for <br> Rights <br> （H） |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $05 / 11 / 2019$ | $05 / 11 / 2019$ | HKMK | 5 |  |  |  |  |  |  |  |
| Rights |  |  |  |  |  |  |  |  |  |  |
| Quantity |  |  |  |  |  |  |  |  |  |  |
| （I） |  |  |  |  |  |  |  |  |  |  |

Note：Please repeat the position adjustment if more than one corporate actions with different ex－dates for the same instrument are required．

Supposing a CP trades instrument（stock）with corporate action announcement，the original traded positions before corporate action adjustment is shown below：

| Trade date | Instrument code <br> $(\mathbf{X})$ | Quantity <br> $(\mathbf{Y})$ | Contract value <br> $(\mathbf{Z})$ |  |
| :---: | :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 5 | 400 | 24,000 |  |
| $05 / 11 / 2019$ | 5 | -600 | $-20,000$ |  |

Only the position traded before ex－date is required to create the benefit entitlement position． To create the rights issue position，the instrument code will be the Rights Code．The position quantity will be equal to the original stock position quantity times the rights quantity． The contract value will be set as 0 ．
i．e．the positions after corporate action adjustment will be：

| Trade date | Instrument code | Quantity | Contract value |
| :---: | :---: | :---: | ---: |
| $04 / 11 / 2019$ | 5 | 400 | 24,000 |
| $04 / 11 / 2019$ | SRI5 | 600 | 0 |
| $05 / 11 / 2019$ | 5 | from $(Y) \times(I)$ | （set as 0 for SRI） |

## 4．4．5 Combined Effects on Position Adjustment for Combination of Corporate Actions

Supposing there is a combo of corporate action events shown in the Corporate Action Position Adjustment Report on the same ex－date：

| Business Date | Ex－Date | Market | Instrument Code （A） | Converted Instrument Code （B） | Quantity Conversion Ratio （C） | Instrument Code for Cash Dividend （D） | Cash Dividend Amount （E） | Instrument Code for Stock Dividend （F） | Entitled Stock Quantity （G） | Instrument Code for Rights （H） | Rights Quantity <br> （I） |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 05／11／2019 | 05／11／2019 | HKMK | 5 | 5 | 2 | DIV5 | －0．78 | DSP5 | 0.13 | SRI5 | 1.5 |

Note：Please repeat the position adjustment if more than one corporate actions with different ex－dates for the same instrument are required．

Supposing a CP trades instrument（stock）with corporate action announcement，the original traded positions before corporate action adjustment is shown below：

| Trade date | Instrument code <br> $(\mathbf{X})$ | Quantity <br> $(\mathbf{Y})$ | Contract value <br> $(\mathbf{Z})$ |  |
| :---: | :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 5 | 400 | 24,000 |  |
| $05 / 11 / 2019$ | 5 | -600 | $-20,000$ |  |

Only the position traded before ex－date is subject to the position quantity adjustment and required to create the benefit entitlement position．Since there are stock split，cash dividend，stock dividend and rights issue together，it is required to adjust position quantity and create 3 benefit entitlement positions for them．The instrument code，position quantity and contract value will be produced in the same way as an individual corporate action described above．
i．e．，the positions after corporate action adjustment will be：

| Trade date | Instrument code | Quantity | Contract value |
| :---: | :---: | :---: | :---: |
| 04／11／2019 | $\begin{gathered} 5 \\ \text { from }(B) \end{gathered}$ | $\begin{gathered} 800 \\ \text { from }(Y) \times(C) \end{gathered}$ | $\begin{array}{r} 24,000 \\ \text { from }(Z) \end{array}$ |
| 04／11／2019 | $\begin{aligned} & \text { DIV5 } \\ & \text { from (D) } \end{aligned}$ | $\begin{gathered} 0 \\ \text { (set as } 0 \text { for DIV) } \end{gathered}$ | $\begin{array}{r} -312 \\ \text { from }(Y) \times(E) \end{array}$ |
| 04／11／2019 | $\begin{aligned} & \text { DSP5 } \\ & \text { from (F) } \end{aligned}$ | $\stackrel{52}{ } \text { from }(Y) \times(G)$ | 0 （set as 0 for DSP） |
| 04／11／2019 | $\begin{aligned} & \text { SRI5 } \\ & \text { from }(H) \end{aligned}$ | $\begin{gathered} 600 \\ \text { from }(Y) \times(I) \end{gathered}$ | $\begin{array}{r} 0 \\ \text { (set as } 0 \text { for SRI) } \end{array}$ |
| 05／11／2019 | 5 | －600 | －20，000 |

## 4．4．6 Position Adjustment for Stock Conversion

Supposing there is a stock conversion shown in the Corporate Action Position Adjustment Report：

| Business Date | Ex－Date | Market | Instrument Code （A） | Converted Instrument Code （B） | Quantity Conversion Ratio （C） | Instrument Code for Cash Dividend （D） | Cash Dividend Amount （E） | Instrument Code for Stock Dividend （F） | Entitled Stock Quantity （G） | Instrument Code for Rights （H） | Rights Quantity （I） |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 05／11／2019 | 05／11／2019 | HKMK | 8359 | 150 | 1 |  |  |  |  |  |  |

Note：Please repeat the position adjustment if more than one corporate actions with different ex－dates for the same instrument are required．

Supposing a CP trades instrument（stock）with corporate action announcement，the original traded positions before corporate action adjustment is shown below：

| Trade date | Instrument code <br> $(\mathbf{X})$ | Quantity <br> $(\mathbf{Y})$ | Contract value <br> $(\mathbf{Z})$ |
| :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 8359 | 5,000 | 6,650 |

Only the position traded before ex－date is subject to the position adjustment．Instrument code will be changed to Converted Instrument Code．For positions that require the adjustment，the new position quantity after adjustment will be equal to the original position quantity times the quantity conversion ratio．The contract value remains unchanged．
i．e．the positions after corporate action adjustment will be：

| Trade date | Instrument code | Quantity | Contract value |
| :---: | :---: | :---: | :---: |
| $04 / 11 / 2019$ | 150 <br> from $(B)$ | 5,000 <br> from $(Y) \times(C)$ | 6,650 <br> from $(Z)$ |

## 4．5 Cross－day Position Netting

For margin calculation，CPs＇positions will be netted across days at instrument level．Thus，all positions quantities and contract values of the same instrument with different trade dates， settlement dates will be added together to come up with one cross－day netted quantity and contract value for each instrument．Please note that all cross－day position netting should be performed after considering SSC／SCC and corporate action adjustments．

Supposing a CP trades an instrument every day across a period and the positions are not yet settled，the positions before cross－day netting are shown below：

| Trade date | Settlement date | Instrument Code <br> $(\mathbf{A})$ | Quantity <br> （B） | Contract value <br> （C） |
| :---: | :---: | :---: | :---: | :---: |
| 01－Nov－2019 | 05－Nov－2019 | 5 | 400 | 24,000 |
| 04－Nov－2019 | 06－Nov－2019 | 5 | -800 | $-49,600$ |
| 05－Nov－2019 | 07－Nov－2019 | 5 | 1200 | 73,200 |

The position after cross－day netting is shown below：

| Instrument Code <br> （D）＝Grouped by（A） | Quantity <br> （E）$=$ Sum of（B） | Contract value <br> （F）＝Sum of（C） |
| :---: | :---: | :---: |
| 5 | 800 |  |

The market value of the position should be determined by multiplying the market price of the instrument to the cross－day netted position quantity．

Supposing the market price of instrument 5 is $\$ 70$ ，the marginable position would become：

| Instrument Code <br> （D） | Quantity <br> （E） | Contract value <br> （F） | Market value <br> （G）$=$（E）$\times$ Market price |
| :---: | :---: | :---: | :---: |
| 5 | 800 | 47,600 | 56,000 |

## 4．6 Cross－currency Netting on MTM Requirement

Favorable MTM／MTM requirement on positions will always be netted off against each other on its own currency first．If there is net favorable MTM in one currency，it could be used to offset against the net MTM requirement in other currencies．The net favorable MTM in original currency is converted to HKD equivalent by using the exchange rate with haircut applied to mark down the amount．The net MTM requirement in original currency is converted to HKD equivalent by using the exchange rate with haircut applied to mark up the amount．

Supposing 2 CPs who are the counterparty to one another on all positions they traded：

## Clearing Participant A

| Instrument <br> Code | Position <br> long／ <br> （short） <br> quantity | Position <br> contract <br> value | Currency | Instrument <br> price | Position <br> market <br> value | MTM | FX <br> rate $^{54}$ | Haircut <br> rate $^{55}$ |
| :---: | :---: | :---: | :---: | ---: | ---: | ---: | ---: | ---: |

| 80737 | 5,000 | 15,000 | CNY | 3.5 | 17,500 | $-2,500$ | 1.15 | $3 \%$ |
| 81388 | 600 | 25,200 | CNY | 40 | 24,000 | 1,200 | 1.15 | $3 \%$ |
| 9167 | -100 | -900 | USD | 9.5 | -950 | 50 | 7.8 | $1 \%$ |

MTM（HKD equivalent）
$=(-2,000)+[(-2,500+1,200) \times(1.15) \times(1-3 \%)]+[(50) \times(7.8) \times(1+1 \%)]$
$=(-2,000)+(-1,450)+(394)$
$=-3,056$（＋ve MTM means loss and－ve MTM means gain to CP）
Favorable MTM for Clearing Participant B＝HKD3，056
MTM requirement for Clearing Participant $B=$ HKDO

## 4．7 Intra－day MTM Requirement Calculation

Upon the launch of VaR Platform，there would be a scheduled intra－day MTM run at around 11：00 a．m．HKT on each business day．There would also be another round of intra－day MTM run at around 2：00 p．m．HKT if there is a holiday margin call arrangement on the full trading day before long holiday ${ }^{56}$ ．

There are multiple batch settlement runs in CCASS to settle the stock positions during the day． CPs could deliver stocks to settle their short positions．CPs could also arrange cash prepayments and withdraw the settled long positions resulting allocated shares intra－day．All these settlement activities would result in a change in marginable positions for MTM and margin calculation．

## 4．7．1 Intra－day MTM Requirement Calculation（11：00 a．m．HKT）

Since the settlement of stock positions occurs during intra－day while money settlement occurs at day－end，unposted debit and unposted credit would be resulted during intra－day MTM requirement calculation to reflect the outstanding risk exposure．

Unposted debit is the pending collection amount from the CP resulting from the settled stock positions that the counterparty has delivered．

Unposted credit is the pending refund amount to the CP resulting from the settled stock positions that the CP has delivered．

[^19]Unposted debit has to be included as a marginable long position during intra－day MTM requirement calculation．While for any unposted credit and cash prepayment arranged by the CPs，an offset ratio will be calculated to adjust the existing marginable long positions．

Supposing two CPs who are the counterparties to one another on all positions，positions \＃700 and \＃9167 are to be settled today．CP B has delivered 50 shares of \＃700．Thus， $\$ 20,000$ unposted debit is booked to CP A and $\$ 20,000$ unposted credit is booked to CP B．

For CP A，assume a cash prepayment of HKD equivalent $\$ 11,755$ has been made，which covers $25 \%$ of the total gross payable settlement amount of the day（ $20,000+900 \times 7.8+$ $20,000=47,020$ ）．Thus，a $25 \%$ offset ratio will be used to adjust the marginable long positions．

For CP B，$\$ 20,000$ unposted credit is available after the delivery of 50 shares \＃700，which covers $100 \%$ of the total gross payable settlement amount of the day（ $15,000 \times 1.15=$ 17,250 ）．Thus，a $100 \%$ offset ratio will be used to adjust the marginable long positions．

## Clearing Participant A

Marginable positions before cash prepayment offset

## 4．7．2 Intra－day MTM Requirement Calculation（2：00 p．m．HKT）

Since the collection time of the intra－day MTM and the settlement obligation are the same upon the launch of VaR Platform，any stock position to be settled today including unposted debit，unposted credit，cash prepayment and allocated shares are excluded from the intra－ day MTM and margin requirement calculation to avoid the collection of MTM and margin requirement from those positions which will be settled at the time of collection．

## Clearing Participant A
